2.7 An external style sheet is a separate file with a css extension with all CSS style definitions for the HTML page. we can reference this file in the <link> tag inside the <head> in html.

· Since the CSS styling is entirely separated from the html document it makes the code easier to understand and maintain.

Also we can use the same CSS file to style multiple html pages. And any changes are applied to all the linked html files since all files are connected to the css.

Example:

```
<head>
<title> Webpage </title>
<link rel='stylesheet' type ='text/css'
href ='style.css'>
</head>
<body>
<h1> Hello </h1>
<p> I am Vinit </p>
</body>
</html>
```

· css file →

```
p {font-size:14px:
}

h1 { background:color:red;
}
```
